UNITED STATES INTELLIGENCE BOARD  
COMMITTEE ON DOCUMENTATION

National Cash Register "Photochromic Micro Imagery" Presentation

1. The Electronics Division of the National Cash Register Company (NCR), Hawthorne, California, has developed a technique for the storage and retrieval of document images which they call "Photochromic Micro Imagery". It is based on NCR-developed photochromic materials which, they claim, make very high resolution and high density document storage feasible. It combines the features of reduction of 200:1, relatively highspeed random access, visibility of images upon exposure, and image erasability in one device.

2. The NCR people will describe this technique for interested parties on 23 February 1961 at 1000 hours in the CIA East Building Conference Room. Please call the names of prospective attendees to the Secretary on Code 163 Extension 8944 by 20 February.
